Supplemental Information

New Drugs in Development

as of November 5, 2009

In our ongoing effort to create products that will promote the health of more people worldwide, Ono has many new drug formulations under development, including the following major drugs:

ONO-2540 / ENA713D (transdermal patch)

ONO-2540 or rivastigmine patch is a drug for the treatment of Alzheimer's disease with an inhibitory action on both acetylcholinesterase (AChE) and butyrylcholinesterase (BuChE). The drug inhibits not only AChE which is known as an enzyme deeply involved in Alzheimer's disease, but also BuChE which reportedly increases as the disease progresses. Therefore, the drug is expected to have an effect in patients who do not respond to existing drugs. The rivastigmine patch is the first transdermal system developed for the disease and is expected to provide greater convenience, e.g. caregivers can easily confirm the administration of the drug.

Japan: Phase III / Alzheimer's disease (co-development with Novartis Pharma K.K.)

Europe & US: Marketed (Novartis AG)

ONO-7847 / MK-0517 (injection)

ONO-7847 is a neurokinin (NK) 1 antagonist, and is the prodrug of ONO-7436 (Emend® Capsules) available in injectable form. The development for prevention of chemotherapy-induced nausea and vomiting has been pursued.

Japan: Phase III / Chemotherapy-induced nausea and vomiting

Overseas: Phase III / Chemotherapy-induced nausea and vomiting (Merck & Co., Inc.)

ONO-7643 / RC-1291 (tablet)

ONO-7643 is a small molecule ghrelin mimetic and the development is underway in cancer anorexia / cachexia. The drug is a low molecular weight substance having similar pharmacological actions to ghrelin, which is a circulating peptide hormone that has multiple physiological actions, including appetite stimulation and muscle-building (anabolic) effects. The compound is therefore expected to be a breakthrough drug that would improve patient quality of life (QOL) impaired by exhausted general conditions based on anorexia and loss of body fat and muscle mass associated with progression of cancer

Japan: Phase I / Cancer anorexia / cachexia

US, etc.: Phase II / Cancer anorexia / cachexia (Helsinn Therapeutics (U.S.), Inc.)

ONO-5334 (tablet)

ONO-5334, a cathepsin K inhibitor, is being developed for osteoporosis with a novel mechanism of action. Unlike bisphosphonates, the drug only inhibits bone resorption without having impact on bone formation.

Japan: Phase I / Osteoporosis

Europe: Phase II / Osteoporosis

ONO-8539 (tablet)

ONO-8539 is a selective antagonist of EP1, one of subtype receptors of prostaglandin E2, and overactive bladder is the first indication for its clinical development program. It is expected that the drug can be given to the patients who are complicated with glaucoma for which use of anticholinergics is limited due to its mechanism of actions and with lower urinary obstruction including benign prostatic hypertrophy.

Japan: Phase I / Overactive bladder

Europe: Phase II / Overactive bladder

ONO-4641 (tablet)

ONO-4641 is a sphingosine-1-phosphate (S1P) receptor agonist, being developed for the treatment of multiple sclerosis. The drug is a low molecular weight substance that keeps lymphocytes in lymph nodes and reduces the lymphocyte count in the blood, as a result inhibiting the infiltration of lymphocytes into lesions. The compound is therefore expected to be an innovative drug for the treatment of autoimmune diseases such as multiple sclerosis, which is regarded as an intractable disease.

Japan: Phase I / Multiple sclerosis

US: Phase I / Multiple sclerosis

ONO-4538 / MDX-1106 (injection)

ONO-4538, a fully human anti-PD-1 antibody, is expected to be a potential treatment for cancer and other diseases. PD-1 is one of the receptors expressed on activated lymphocytes, and is involved in the negative regulatory system to suppress the activated lymphocytes. It has been reported that tumor cells utilize this system to escape from the host immune responses. It is anticipated that blockade of the negative regulatory signal mediated by PD-1 will

promote the host's immune response, in which tumor cells and viruses are recognized as foreign and eliminated.

Japan: Phase I / Cancer

US: Phase I / Cancer and hepatitis C (co-development with Bristol-Myers Squibb)

ONO-3849 (injection)

ONO-3849 is a peripherally acting mu-opioid receptor antagonist, and is developed for opioid-induced constipation. Opioid pain medications are mainly used for the treatment of pain in cancer and other advanced illnesses, but often cause constipation in many of these patients. ONO-3849 is expected to decrease the constipating effects of opioid pain medications in the gastrointestinal tract without affecting their ability to relieve pain.

Japan: Phase I / Opioid-induced constipation

Overseas: Marketed / Opioid-induced constipation (Wyeth)

ONO-7746 (capsule)

ONO-7746 is an orally active low molecule compound which may increase platelet count by activating a receptor of thrombopoietin, which is a hematopoietic factor to accelerate platelet production. The compound will be developed as a new drug which may reduce the risk of bleeding in various diseases with thrombocytopenia and overcome risk of infection associated with platelet transfusion.

US: Phase I / Thrombocytopenia

<New Dosage Regimen>

ONO-5920 / YM529 (tablet)

ONO-5920 is a drug for the treatment of osteoporosis, and is intermittently administered oral formulation of Recalbon® Tablets.

Japan: Phase III / Osteoporosis (co-development with Astellas Pharma Inc.)

<Additional Indications>

Emend® Capsules (MK-0869)

Japan: Phase III / Chemotherapy-induced nausea and vomiting in children
